Abstract

Historical records of Earth show that everything is in a state of change, of which Climate is one. This paper recognises this fact and supports this concept. Applying statements of false information are promoted firstly by showing that humans somehow were responsible for those dramatic seasonal changes as being sub-normal. Secondly, and in recent times, they tell of these notions that support these changed thoughts. To those who use this propaganda to make money and/or make them stand out to make a good public person. Thirdly, these people used their respective financial status to give them a secure profile in the public arena, selling their belief to the media to make profit from Wind Farms, Solar Systems and the like, to convey to the public that they were to blame for these seasonal changes, and it was initiated by the increase of Carbon Dioxide they were producing since the 1880 Industrial Revolution. To the ordinary public, their argument was accepted; however, it was all based on ill-informed information introduced by Mr Al Gor's "In creditable Truth" journey, for within this paper we show the truth as it is occurring and happening, now.

Key words: Climate is Natural, Sun's Heliosphere, Earth's Magnetosphere, Wind Farms, Solar System, Australia, Barometric Pressure, gravitywatson (gw), Mauna Loa Observatory and Water Vapour.

INTRODUCTION

I am writing this paper to show of my deep concern from my research into the forthcoming imaginary environmental disaster, which we will all enjoy when a real financial disaster strikes humanity. My research showed that this present drought up to 2015 of Northern Australia has been initiated by the effect as spoken about here and my research into the how, why and when this will all happen. To make it, this letter is to see what has been accomplished and hopefully, and to have my book pre-printed for such a journey. I'm still waiting for a supporting financier to support and re-publish.

The following graphic illustrates a point of my records which were taken further by the Bureau of Meteorology, Australia. This shows the relationship shift between the LOW barometric pressures for two year cycles. I draw your attention to what has happened during each mid-section of each year. You will note that the year 2000 had deep lows; this is because the Southern Magnetic

fields were being attracted to the Sun's Heliosphere which at that time was in a Positive magnetic mode. Now our Earth is in a Negative mode sector of the Sun's Heliosphere, and is forcing such lows further south, thereby causing this dramatic change to our weather patterns, as shown below. (Figure 1)

As the year 2000 was before the observed Sun's Heliosphere 'switch', and whilst the Year 2015 results are typical of what has happened since then, the year of 2012 highs & lows ran almost parallel to those of 2015 except the trend seems to be more towards low pressures in our spring/summer period and high pressures in our autumn/winter period. The month of June 2015, had an averaged low of 1018mb, and these values were also experienced in this year's graphic above, as they were experienced during our summer of 2001, is quite the reverse to our accepted idea of what

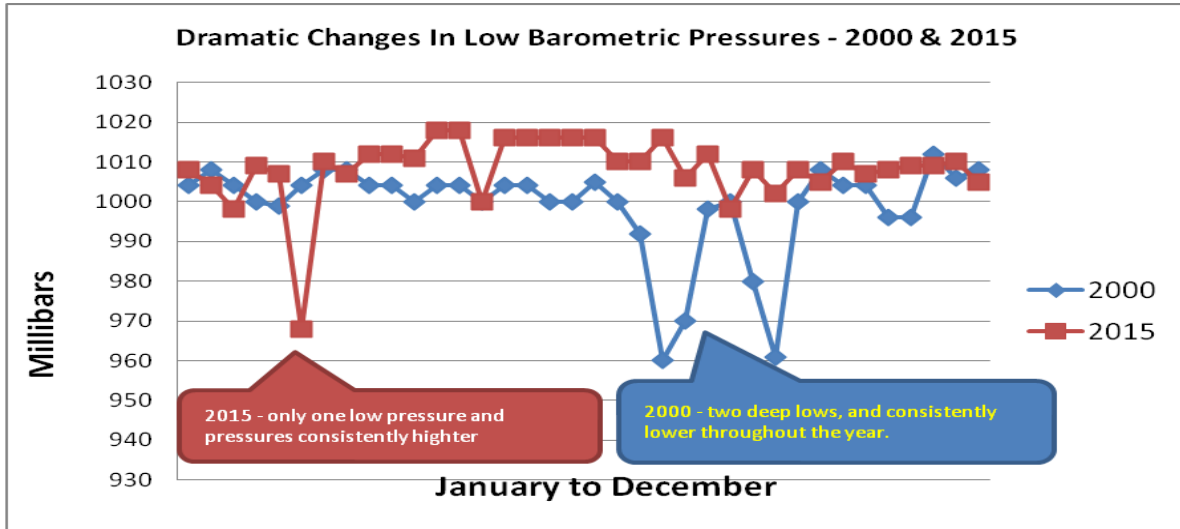

Figure 1: Dramatic Changes in Low Barometric Pressures – 2000 & 2015

we considered as ‘normal’ In practice the High to Low Barometric Pressure systems divide at 1010mb, and as you can observe in this scale, that the Lows are indeed a very High value for March to August in 2015! You can see the expected 2016 lows are heading down again for our summer season to come! This cycle has arrived and we are currently experiencing Heavy Rains in many parts of the continent of Australia.

It may not be politically correct in the minds of those who believe that we are facing a man-made catastrophe, for I believe strongly that if mankind decided today to stop producing Carbon Dioxide worldwide, it would not stop this present Climate Change drifting back to what we were acclimatized to prior to 15 February 2001:

"Change in our climate is not a new phenomenon! It is a continuous process caused by a variety of factors"

I must introduce a new point here. My research achieved a positive connection between the Electron Mass Diameter to its Nucleus Mass Diameter for all elements/atoms and this connection to the term Gravity has an association that generates my new understanding of what I’m calling gravity as a ‘gw’ force. This gravitywatson force is generated from within each atomic structure. Science is calling, Gravity, for I have shown in my books that it is the same force as the magnetic field for all magnetic forces within the world. It is also the same force science is calling the ‘Magnetosphere’. Our Sun has a large force and science calls it the ‘Heliosphere’. We observe a Sun Spot cycle and this function has an average basically occurring every eleven years. In fact this sequence can vary from 9.4 to 12.2 years. Science is aware of these variations. The NASA (USA) format graphic of the sun’s switching over the last

few decades is most enlightening as it showed the internal features that support my theory in that at the equator sections of the Sun’s graphic “the Butterfly Graphic” an interweaving response to what I’m calling ‘the equal and opposing effects of the two magnetic forces, called the north and south poles’ It was this graphic that totally supports my mathematical findings that the magnetic force and gravity stem from this same magnetic force. It was at this point that satisfied me that Carbon Dioxide does not control our Climate Change. You may observe this yourself in the graphic below. (Figure 2)

It is noteworthy that the change in pattern occurred precisely and abruptly! It was not a gradual change that might be indicated by a slow but steady increase in the level of CO2, if indeed CO2 levels have anything to do with it. For the record, cast your mind back beyond that of the usual public recollection (which seems to extend to no more than just the last week or so – if that) you might recall what has been happening further north towards the Equator and the Tropics earlier this year of 2016, and into last year. There were heavier than ‘normal’ rainfalls caused by extremely deep low-pressure systems, e.g. torrential rains and floods in northern New South Wales & Queensland – and very recently in 2016! (The same thing occurred in the Northern Hemisphere too; viz.: serious floods in England!) So what has changed? The locations of the weather systems have moved!

Now, can you think of just one explanation in all logic to demonstrate how any amount of CO2 could initiate this to occur – including over the Nullarbor Plain where there is not very much industrial activity? Except perhaps for the activities of feral animals! Seriously though, I believe that the reason for the movement can be traced to the natural cycle of change in the magnetic interrelationship as mentioned above, and that in due time the Sun will appear

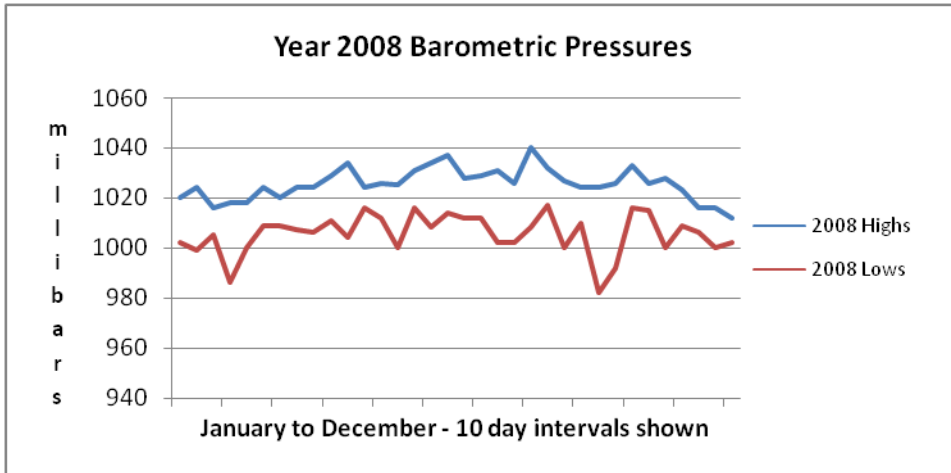

Figure 2: Year 2008 Barometric pressures

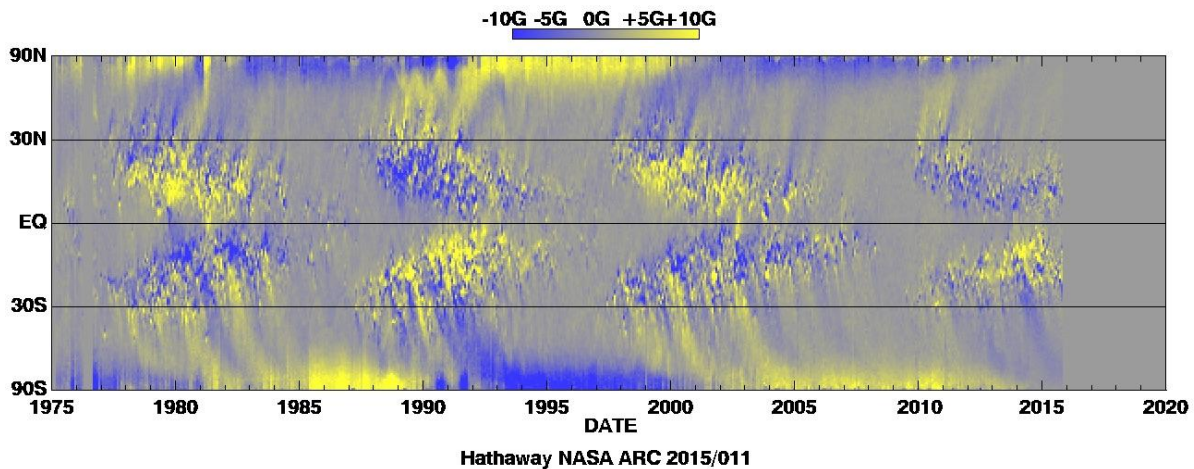

Figure 3: Hathaway NASA 2015/011

to have 'switched' yet again to another new seasonal pattern for the next Solar Cycle as it did on the 22 December 2012, and while there, we have experienced this current Climate Change for some three years and beyond this date to another dramatic eleven year cycle with an expected change in 2023! Here, I draw your attention to the reversing cycle of our Sun dating from 1975 to 2012 when this present cycle switched. The "V" structures within this graphic show the interaction of the north and south magnetic pole field that I have been speaking of, and with supporting evidence to substantiate my claims, however, here I can only show you that there is serious doubt about the claims that Carbon Dioxide (CO₂) is the cause of the present Climate Change switch of the Sun's Corona. In actual fact it is the position of the Earth within the Sun's Heliosphere that has changed. The Sun does not switch. It is an illusion of the orbital

position of Earth being viewed from within the Sun's Heliosphere. (Figure 3)

Global Temperature Trends & Concentrations of CO₂ in the Atmosphere

And what do you see here? This graph shows the temperature records for the last six years from some of the World's most respected meteorological institutes: the U.K.'s Hadley Centre, and the University of Alabama in the U.S.A., together with observations from the Mauna Loa Observatory on Hawaii. Both the observations from the University of Alabama and the Hadley Centre show a clear downward cooling trend in temperatures despite the rising trend of atmospheric CO₂ recorded at Mauna Loa. An interesting observation is here, just 35km away.

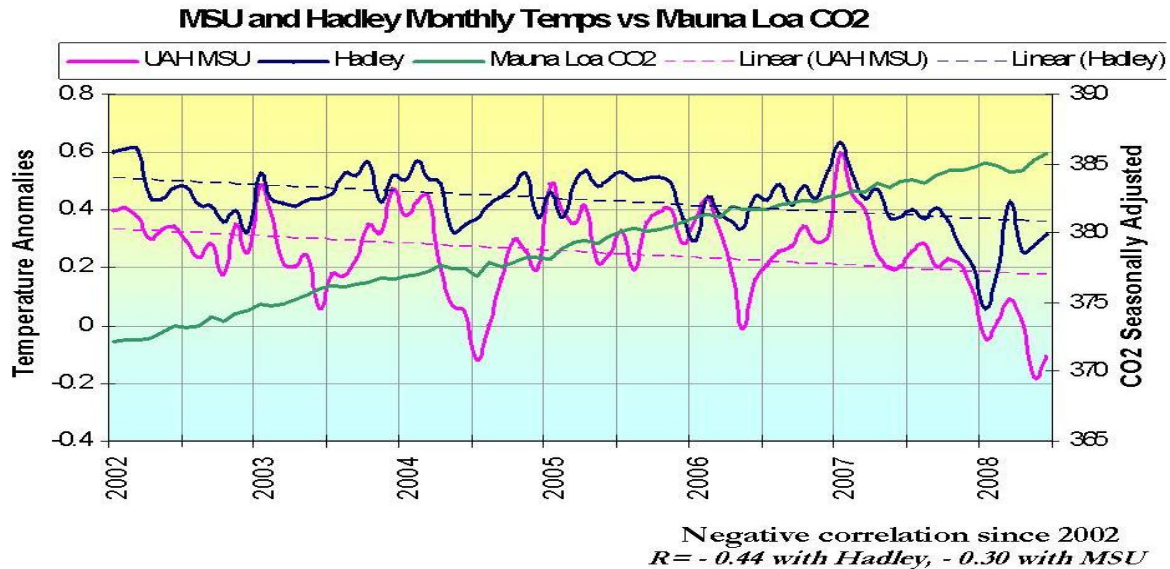

Figure 4: MSU and Hadley Temperature vs Mauna Lao CO2

There is one volcano emitting between 4,000 to 8,000 metric tonnes of CO2 per day. There are four other volcanoes within the island of Hawaii. The IPCC have used these CO2 values that are presented to all parliaments, indicating the increased value in CO2. (Figure 4)

The peaks within this graph reflect the higher temperatures expected in each summer period and, of course, the troughs show the lower winter temperatures for the years between 2002 & 2008. The dotted lines show these temperature anomalies 'smoothed' to show the averages during this period. From this you can see quite clearly that the average temperature of Earth has been falling despite the level of CO2 rising, constantly. This is contrary to the predictions made by the advocates of global warming, and seems to indicate rather well that the CO2 is not warming the Earth, despite increasing levels of CO2! CO2 follows the Earth's temperature by some 200 to 800 years as the "Vostok Ice Core" values clearly show in my original Book. CO2 becomes saturated when it reaches 400 parts per million by volume.

Melting Sea Ice & Retreating Glaciers

So now let's look at one of the most popular and prevailing myths about the melting of sea-ice and the retreat of glaciers. Movies of large pieces of ice falling from glaciers and breaking off into the sea have been used continuously by the Media to give the impression that it is warming that is causing this rather than the obvious which is that it is a continuous process due to the immense pressure and weight that forces this ice flow to ever be drawn down and forward. Dr Goebbels would

have been proud of this propaganda! So let's look at some real facts!

Science has proven that the Antarctica land masses are rising. As the ice shelf is also being lifted above its settled mass form over the ocean and its weight will force the sheet mass to break off and of course, a film crew happened to be there when this displacement took place. The Ice shelf is not melting; it is the weight of the Ice Shelf that broke off due to the rising land masses over a long period of time.

And one of these facts is that amount of ice breaking off is less than 0.1% of the total ice volume of the shelf. So here's the extent of sea ice was at the Arctic first (9th December 2008): (12.9.2008 American dating) (Figure 5). Glaciers are expanding again! Only next door in New Zealand the Fox and Franz Joseph Glaciers are increasing:

[http://www.iceagenow.com/List_of_Expanding_Glaciers.htm!](http://www.iceagenow.com/List_of_Expanding_Glaciers.htm)

CONCLUSION

Our Sun is the dominant power of seasonal change, not us – no matter how much we might like to posture and flatter our egos to the contrary. So let's get things into perspective! The Sun is 1,300,000 times the volume of the Earth and the Sun is in control, and there is nothing we can do about it! So perhaps now we can have some less hysterical decision-making, and some more logically-based policies aimed at efficient adaption to constant changes. Allow me to correct another extremely politically incorrect statement: to get the truth about our continuously changing climate one must separate both

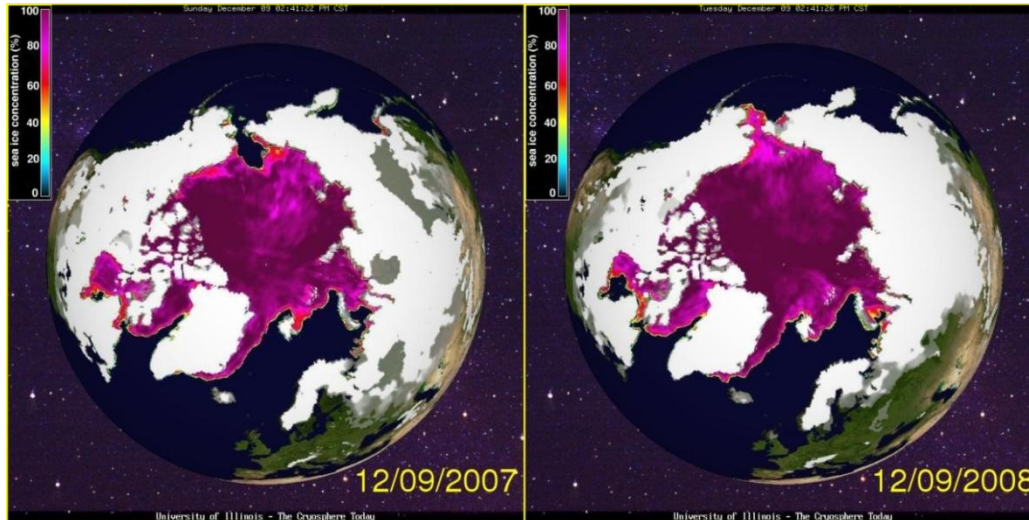

Figure 5: 12.9.2008 American dating

political bias and Green religious fervour from pure science & logic!

And finally a request: please do your bit to encourage the Media not to show cooling towers emitting harmless water vapour as this implies arrogance of the knowledge that our Governments are showing that these benign monoliths are somehow responsible for the CO2 pollution and therefore global warming, global cooling, or climate change! I know that cooling towers look spectacular, but people panic when they observe large masses of so called CO2 spilling from those towers.

It is actually, Water Vapour H2O!
