Abstract

The incessant failure of Nigerian deposit money banks has raised queries on audit quality in the Nigerian banking sector. Hence, the study examined relationship between Audit Quality and Earnings Management in Nigerian listed deposit money banks. The study adopted a longitudinal research design and secondary data covering a period of 2005-2014 were collected. The population of the study comprised fifteen (15) deposit money banks listed on Nigerian Stock Exchange as at 2016, out of which six (6) banks were randomly selected resulting in 60 observations. Panel data technique was employed, while fixed and random effects model were used for estimation. Descriptive Statistics, Pearson correlation coefficient and simple pooled OLS regression analysis were used for analysis to determine possible link between the variables identified. The results of the study showed that a significant positive relationship existed between joint audit and earnings management ($\beta_1 = 1.054533$; $t = 2.34$; and $p = 0.0023 < 0.05$), which implies that a change to joint audit from single audit increases earnings management. Also, a significant negative relationship existed between audit specialization and earnings management ($\beta_2 = -0.0302366$; $t = -2.07$; and $p = 0.043 < 0.05$), which implies that every unit increase in audit specialization decreases earnings management. Furthermore, a significant positive relationship existed between audit independence and earnings management ($\beta_4 = 0.6010025$; $t = 4.96$; $p\text{-value at } 0.008 < 0.05$). However, there was an insignificant negative relationship between audit tenure and earnings management ($\beta = -0.0078915$; $t = -0.12$; $p = 0.906 > 0.05$). The study concluded that lengthy audit tenures were mechanisms adopted by banks' managers to influence auditors' objectivity in the course of audit assignment. Therefore, the study recommended that lengthy audit tenure be discouraged.

Keywords: Joint Audit, Audit Specialization, Audit Independence, Audit Tenure and Audit Quality.

INTRODUCTION

In recent times, the call for reliable financial reporting has gained prominence in Nigeria and global economy at large. The capability or incapability of banks to effectively fulfil intermediate mandate has been the crux of many financial crises. Mediating between the surplus and deficit units within the economy expedites distribution of national

savings, thereby improving investments and national output. In 2005, the Central Bank of Nigeria mandated every Nigerian bank to increase capital base from 2 billion naira to 25 billion Naira in order to enhance competitiveness in the international market. Noteworthy capital market expectations were raised and banks were under pressure to achieve survival and generate higher returns to shareholders. This pressure from the Central Bank of Nigeria has occasioned banks falsifying accounts, inflating earnings and capital. The need for

reliable reports has led to statutory audit that provides independent authentication of financial statements prepared by banks' directors.

Auditors are instructed to report financial misdemeanors in company's accounts to increase transparency and accountability through fraud detection. Earnings are made up of accruals and cash items and accruals are basically controlled by company's stewards. Management can bloat performance of company and future earnings predictions through manipulation of accruals resulting in earnings management. Financial reports contain accounting information which different users use to appraise firm's performance. Investors use cash flow statement to make investment decisions thereby creating room for highly motivated and intelligent management teams to manipulate the real economic operations to influence the true picture of a company's cash flow from operations. Since accrual accounting measures the performance of company by recognizing economic events irrespective of when transactions occur. Earnings management is therefore, discovered by conducting tests on the components of accrual assumed to be at the managerial discretionary accruals thereby revealing information asymmetries. Accounting scandals experienced in the last few years have affected the regulators' trust of financial statements. This scandal and its consequent results are reasons for drawing attention to quality and reliability of financial statements in the banking sector. Therefore, the absence of investors' confidence in the reported earnings influence the financial market because investors are major players in ensuring availability of capital to support the economic system. Given the above state, this study seeks to assess the effect of audit quality on earnings management in Nigerian listed deposit money banks. The broad objective of this study is to identify relationship between audit quality and earnings management of Nigerian listed money deposit banks while to assess relationship among joint audit, auditor specialization, auditor independence and audit tenure on the earnings management in the listed deposit money banks in Nigeria would need to established. The need

LITERATURE REVIEW

Concept of Earnings Management and Quality

Earnings management and earnings quality are closely related concepts and researchers generally agree that highly managed earnings indicate poor audit quality (Lo 2008; Ball and Shivakumar 2007). Many factors contribute to earnings quality, hence the absence of earnings management is lacking to assume earnings quality (Lo 2008). Earnings quality is a broader term that scientists interpret differently, depending on the specific

situation is applied. McNichols (2002) described earnings quality as elusive in the sense that extant literature only identifies diverse characteristics associated with it (Givoly, Hayn & Katz 2010). Dechow and Schrand, (2010) believed that earnings quality provide more information about the features of a firm's financial performance that are relevant to specific decisions made in the organizations.

Simply put, whether an earnings quality is regarded as of high or low quality depends on the extent of information presented about a firm's financial performance. High earnings quality implies less information asymmetry, and investors and other stakeholders make more appropriate decisions, based on a more realistic view of the company performance. Low earnings quality implies the presence of earnings management and investors and other stakeholders become misinformed and misguided.

In the light of this, accruals exhibit different kinds of problems since managers' aim at making company appear desirable and attractive, they tempt to use discretions to handgrip accruals to signal private information or manipulate earnings. Various researchers claim that abnormal accruals measure the degree of earnings management, which is seen as a dimension of earnings quality.

Review of Empirical Studies

The debate on the relationship between audit quality and earnings management is unending because of inconsistent empirical findings from singularity of interest. While some empirical studies have reported the abilities of audit quality to significantly constrain earnings management (Gul, Fung and Bikki, 2009; Habbash, 2010; Inaam, Khmoussi and Fatma, 2012), others have reported otherwise.

Joint Audit and Audit quality

Holm and Thinggaard (2012) examined whether joint audit impacts audit quality in the Danish setting. The sample comprises non-financial companies listed on the Copenhagen Stock Exchange (CSE) at the time of joint audit abolishment. They found insignificant coefficients on audit quality measures (abnormal accruals), suggesting that joint audit is not better able to constrain earnings management than single audits. Lesage, Ratzinger-Sakel, and Kettunen, (2012) also examined whether joint audit impacts audit quality in the Danish setting. Their findings showed insignificant coefficients on the abnormal accrual measures for either period. Hence, these confirm that joint audits do not have impact on audit quality, as measured by the level of abnormal accruals. In a study carried out in Denmark, Zerni *et al.*, (2010) examine the impact of the voluntary joint audit on

audit quality in the Swedish setting for the 2001-2007 period. The authors considered a sample of listed non-financial Swedish companies and a sample of privately held firm Swedish. The findings suggested that companies opting voluntarily for joint audits have a higher degree of earnings conservatism, lower abnormal accruals (both are proxies for audit quality), better credit ratings and lower risk forecasts of becoming insolvent within the next few years than other firms (both are proxy measures for perceived audit quality). Thus, the joint audit decision might be driven by minority shareholders who prefer a higher degree of conservatism in the firm's accounting decisions.

Also in Swedish context, Zerni *et al.*, (2010) examine whether corporate governance devices including joint audit can effectively mitigate 'entrenchment discounts.' Zerni *et al.*, (2010) defined the entrenchment problem as the possibility that large shareholders opt to use their power to expropriate minority shareholders by taking actions and investment decisions serving their own interests, leading to suboptimal outcome for minority shareholders. Consequently, entrenchment discounts arise when the non-controlling shareholders expect to face a potential expropriation by the controlling shareholders and discount the share price accordingly.

In a study conducted by Pouraghajan, Tabari, Emamgholipour and Mansourinia (2013), audit firm size was used to measure audit quality and the absolute value of discretionary accruals was used as an indicator of earnings management. Also, the modified Jones model proposed by Dechow, *et al.*, (2010) was used to calculate discretionary accrual. The results indicate that auditing the financial statements of companies by large audit firms (high audit quality) is not effective in reducing the manipulation of discretionary accruals by managers and cannot control the opportunistic behaviours of managers. The obtained results are consistent with the research results of Jeong and Rho (2004) and Abdul and Ali (2006), Memis and Cetenak (2012), but, contrary to research results of Chen, Lin and Zhou (2005), Becker, DeFond, Jiambalvo, and Subramanyam, (1998) and Zgarni (2012). Zgarni *et al.*, (2012) provide evidence that auditors' industry specialization affects negatively the accruals earnings management, as documented in prior studies (Becker *et al.*, 1998; Reichelt and Wang, 2010). The results show a negative and significant influence of the auditor size on reducing accruals earnings management

Auditor Specialization and Audit Quality

The importance of industry specialized auditors is attributable to the research findings that auditor industry expertise is associated with better auditor performance and higher audit quality. Low (2004) examines the effects of industry specialization on auditors' risk assessment

and audit-planning decisions and finds that industry knowledge improves audit risk assessment and influences the perceived quality of audit-planning decisions. One stream of literature argues that auditor industry expertise will help constrain earnings management thereby increasing earnings quality. For example, Balsam *et al.*, (2003) find that clients of industry specialist auditors have lower discretionary accruals and higher earnings response coefficient than clients of non-specialist auditors, suggesting that auditor industry specialization improves earnings quality. Overall prior empirical evidence shows that auditor industry specialization seems to be positively associated with different proxies of audit quality.

Auditor Independence and Audit Quality

Aderibigbe (2005) viewed independence as an emotive word serving as a banner for freedom, integrity and all that is good. Louwers *et al.*, (2007) expressed independence as a mental attitude and physical appearance which portrays the auditor as being uninfluenced by others in judgment and decision. This can be sustained by avoiding financial connection that makes it appear that the wealth of the auditor depends on the outcome of the audit and management connections that makes the auditor appear as if he is involved in management decisions. As a key ingredients of audit quality. Gray and Manson (2000) and Hayes *et al.*, (2005) described independence as a position required in order to take an unbiased viewpoint in the performance of audit tests, analysis of results and attestation in the audit report. Despite all the definitions, and descriptions of auditor independence, Whittington and Pany (2004) concluded that auditor independence is relative and not absolute. Adeyemi and Olookere (2012) suggested in their study that audit and non-audit fees threatened auditors' independence in Nigeria.

Auditor Tenure and Audit Quality

The question of whether audit firm tenure impacts audit quality has long been one of the major issues concerning auditing regulations. Some believe that lengthy auditor tenure undermines independence and objectivity, while others believe that long tenure increases auditor knowledge and competence. Mgbame, Eragbhe and Osazuwa (2012) revealed a negative relationship between auditor tenure and audit quality; though the relationship was not significant. Siregar, Amarullah, Wibowo and Anggraita (2012) carried out their research in the Indonesian environment where regulators had made it compulsory to rotate the appointments of public accountants every three (3) years and the appointment of public accounting firms every five (5) years. Their results showed that mandatory auditor rotation did not increase

audit quality; and that shorter audit tenure (both partner and firm level) did not also increase audit quality.

In a high tax alignment countries financial statements are taken to be the basis for taxation and in fact part of the tax statement, tax authorities are expected to rigorously examine financial statements. Myers, Myers, and Omer (2003) studied the relation between auditor tenure and earnings quality, using the dispersion and the magnitude of both raw and absolute abnormal accruals and current accruals as proxies for earnings quality. Their conclusions suggest that higher earnings quality is correlated with longer auditor tenure. Their interpretation of these results is that, under the research environment, the longer-tenure auditors tend to place greater constraints on extreme management decisions in the reporting of earnings.

METHODOLOGY

This study employed a longitudinal research design to assess the relationship between Audit Quality and Earnings Management in listed deposit money banks in Nigeria. The population for the study comprised fifteen (15) deposit money banks listed on the Nigerian stock exchange as at 31st of December, 2016. This study covered a period of ten (10) years (2005 – 2014) as it collides with events significant to this study which include the mandatory increase in the capital base of banks, Nigerian banking consolidation and global economic meltdown, events which could necessitate competition for fresh capital by companies listed on the Nigerian Stock Exchange which could have encouraged banks to participate in earnings management. Random sampling is the technique employed in selecting six (6) of the deposit money banks listed on the Nigerian Stock Exchange as it involves examination of a permanent sample from which information would be collected several times over a period of time. The six banks selected include First Bank, Guaranty Trust Bank, Zenith Bank, Stanbic IBTC Bank, Diamond Bank and First City Monument Bank. The study used secondary data extracted from published annual reports and accounts of the sampled banks and the Nigerian Stock Exchange fact book for the relevant years. Beaver and Engel (1996) developed a model for measuring allowance for loan loss. They estimated the non-discretionary component of the allowance for loan loss by using a set of information variables, including non-performing loans and net loan charge-offs, that reflect probable loan losses. The discretionary component is then estimated as the difference between the total provision and the estimated nondiscretionary components. Beaver and Engel suggest that this reflects the amount of additional adjustments to the allowance account based on a variety of discretionary motives. The Beaver and Engel (1996) model was adopted in this research. The model is as stated in 3.1 below:

$$LLP_{it} = \beta_0 + \beta_1 CO_{it} + \beta_2 LOAN_{it} + \beta_3 NPL_{it} + \beta_4 NPL_{it+1} + \varepsilon_{it} \dots \dots \dots (3.1)$$

Where:

ALL_{it} = Allowance for loan losses

CO_{it} = net charge-offs

LOAN_{it} = loans outstanding

ΔNPL_{it+1} = one-period-ahead change in nonperforming loans
 ε_{it} = regression residual reflecting estimate of the discretionary portion of all the residual from this equation (ε_{it}) is taken to be an estimate of discretionary component of allowance for loan losses. Given the measure of Earnings Management from model one above, the model two (main model of the study) is expressed as follows:

$$EMG_{it} = \beta_0 + \beta_1 JA_{it} + \beta_2 AUDITEN_{it} + \beta_3 AUDSPEC_{it} + \beta_4 AUDIND_{it} + \varepsilon_{it} \dots \dots \dots (3.2)$$

Where:

EMG_{it} = Earnings Management

JA_{it} = Joint Audit

AUDIND_{it} = Auditor Independence

AUDSPEC_{it} = Auditor industry specialization

AUDTEN_{it} = Audit firm tenure

RESULTS AND DISCUSSION

The Correlation matrix results for all the variables used in the study are presented in Table 1. The results in Table 1 below shows Pearson correlation coefficient of the variables used in this study. The Table indicates a positive association between joint audit and earnings management, audit tenure and earnings management, audit specialization and earnings management and auditor independence and earnings management, but insignificant in all situations.

The results in the Table 2 shows the presence of Heteroscedasticity in the panel as indicated by the Bruch Pagan/Cook-Weisberg test for heteroscedasticity Chi of 7.02 with p-value of 0.0081. This is corrected using OLS (Heteroscedasticity corrected standard errors). The Table 2 also indicates the absence of perfect multi-collinearity among the explanatory variables, as shown by the mean VIF of 9.60. The decision criteria for the Variance Inflation Factor is that a value of 10 and above according to Gujarati (2003) and Wooldridge (2009) implies the presence of perfect multi-collinearity. The results from Table 2 indicates that the independent variables of model one (beginning loan loss allowances, loan charge off, changes in non-performing loans, and total loans outstanding all scaled by total assets) explained around 93.29% of the variations in the total loan loss provision (LLP) of listed deposit money banks in Nigeria, from the coefficient of determinations (R^2 value of 0.9329). The Table 2 also shows that the model is fit as evident by

Table 1: Coefficient of Correlation

e(V)	EMG	JA	TENURE	AUDSPEC	AUDIND
EMG	1				
JA	0.1157 (0.3785)	1			
TENURE	0.0885 (0.5012)	-0.1019 (0.4384)	1		
AUDSPEC	0.0151 (0.9089)	0.0563 (0.6693)	0.1543 (0.2390)	1	
AUDIND	0.1181 (0.3688)	-0.2532* (0.0509)	0.2693** (0.0375)	0.7229*** (0.0000)	1

P-Values in Parentheses *, **, *** denote significant at 10%, 5%, 1% levels, respectively)

Table 2. Summary of Regression Results: Model One

Variables	Statistics	P-values
R- squared	0.9329	
Adj R-Squared	0.9280	
F-Statistic	191.09	0.0000
Root MSE	0.90683	
Hetest	7.02	0.0081
Mean VIF	9.60	
N (Observation)	60	

the F-Statistic of 191.09 which is significant at 1% level of significance (as indicated by the P-value of 0.0000). Therefore, the study measured the earnings management from this regression model, which is the residual of the model (Discretionary Loan Loss Provision). The study also assesses the audit quality (through joint audit, audit tenure, auditor industry specialization, and auditor independence) in relation to earnings management. The regression results (for model 2) are presented and evaluated in the Table 3:

Table 3. Summary of Regression Results: Model Two

Variables	Coefficients	t	P-values
JA	1.054533	2.34**	0.023
AUDSPEC	-0.0302366	-2.07**	0.043
AUDTEN	-0.0078915	-0.12	0.906
AUDIND	0.6010025	2.76***	0.008
CONSTANT	-3.744818	-2.45**	0.018
R Square	0.1632		
Adj. R Square	0.1024		
F-Statistic	2.68**		0.0409
Root MSE	0.82953		
Hetest: Chi	2.96*		0.0854
Mean VIF	1.31		
Ovtest	1.13		0.3466

(* **, *** denote significant 10%, 5%, 1% levels respectively)

Tests were performed as required to decide on which regression method best fits the model and data of the study. The Hausman (1978) Test results recommend the use of Random Effects Regression. The Bruch and Pagan Lagrangian Multiplier Test for random effects indicates the absence of significant statistical variance in

the panel. The Table 3 also shows the absence of perfect multi-collinearity among the explanatory variables, as shown by the mean VIF of 1.31.

The decision criteria for the Variance Inflation Factor is that a value of 10 and above implies the presence of perfect multi-collinearity.

The results in Table 3 shows absence of Heteroscedasticity in the panel as indicated by the Bruch Pagan/Cook-Weisberg test for heteroscedasticity Chi of 2.96 with p-value of 0.0854. This shows that there is no need for a robust OLS. The Table 3 also shows that the independent variables explained around 16.32% of the variations in the earnings management (measured by discretionary loan loss provisions) of the listed deposit money banks in Nigeria. The Table 3 also shows that the model is fit as evident by the F-Statistic of 2.68 which is significant at 5% level of significance (as indicated by the P-value of 0.0409). Following the fitness of the model, the test of hypotheses are formulated. The coefficients of each of the independent variables in the study are also presented in the Table 3. To formulate the regression model,

χ_1 = Joint Audit (JA)
 χ_2 =Audit Tenure (AUDTEN).
 χ_3 =Auditor Industry Specialization (AUDSPEC,
 χ_4 =Auditor Independence (AUDIND),
 β_0 = Constant and Y= Earnings Management.

The equation formulae is given as

$$EMG = \beta_0 + \beta_1\chi_1 + \beta_2\chi_2 + \beta_3\chi_3 + \beta_4\chi_4 + \epsilon \dots\dots\dots(3.3)$$

$$EMG = -3.744818 + 1.054533\chi_1 - 0.0078915\chi_2 - 0.03302366\chi_3 + 0.6010025\chi_4 + \epsilon \quad (3.4)$$

Evaluation of Independent Variables

The value of the intercept β_0 is -3.744818 from table above implies that discretionary accruals will be negative when there is no measure of audit quality to serve as an independent variable or when the independent variables are equal to zero. The coefficient of the independent variables are interpreted as follows:

Joint Audit ($\beta_1 = 1.054533$; $t = 2.34$; and $p = 0.0023 < 0.05$) β_1 is given as the average difference in Y between the category for which joint audit is = 0 and the category for which $x = 1$. The positive coefficient indicates that there is a positive relationship between joint audit and earnings management. Since joint audit as one of the independent variables identified as a determinant is statistically significant to earnings management, we conclude that joint audit is a significant determinant of earnings management in Nigerian listed deposit money banks.

Audit Specialization ($\beta_2 = -0.0302366$; $t = -2.07$; and $p = 0.043 < 0.05$). β_3 at -0.0302366 represents the mean change in the earnings management (discretionary accruals) for one unit change in audit specialization while holding all other predictor variables in the model

constant. Therefore, for every increase in Auditor specialization, there is a decrease in earnings management. Since auditor industry specialization as one of the independent variables identified as a determinant is statistically significant to earnings management, this study holds that audit specialization has a significant relationship with earnings management in Nigerian listed deposit money banks.

Auditor Independence ($\beta_4 = 0.6010025$; $z = 4.96$; p -value at $0.008 < 0.01$) β_4 is 0.6010025, and shows that for every one unit increase in auditor independence, earnings management increases by 0.6010025. Since auditor independence as one of the independent variables identified as a determinant is statistically significant to earnings management, we conclude that auditor independence is a significant determinant of earnings management in Nigerian listed deposit money banks.

Audit Tenure ($\beta_2 = -0.0078915$; $t = -0.12$; $p = 0.906 > 0.05$) β_2 at -0.00789533 shows the mean change in earnings management for an increase in audit tenure while holding all other independent variables constant. Therefore, for every unit increase in audit tenure, there is a decrease in earnings management. Since audit tenure as one of the independent variables identified as a determinant is statistically insignificant to earnings management, we conclude that audit tenure is an insignificant determinant of earnings management in Nigerian listed deposit money banks.

CONCLUSION AND RECOMMENDATION

This research concludes that joint audit has a positive influence on earnings management, which in turn means it has minimally detected earning management activities (discretionary accruals). Audit specialization would be instrumental in reducing earnings management in Nigerian listed deposit money banks based on their negative relationship discovered to be significant, as specialized audit firms are employed in banks, earnings management decrease. Even the reputation of the specialized audit firms discourages some managers from earnings management.

Audit independence (measured by total audit and non-audit fees received) has a significant positive relationship with earnings management, as managers deliver “honorable” fees and engage auditors in non-audit services to increase familiarity and reduce objectivity in the audit process thereby creating room for earnings management.

Shorter audit tenure could result to decreased earnings management. There are more qualitative factors that contribute to audit quality in Nigerian listed deposit money banks. This study concluded that listed deposit money banks in Nigeria.

APPENDIX I**Measurement of Variables**

The dependent variable for this study is earnings management measured by discretionary loan loss provisions. Other variables and their measurements are given in the table below:

Table 3.1. Measurement of Variables

S/N	VARIABLE	DEFINITION	TYPE	MEASUREMENT
1	EMG	Earnings Management	Dependent	Measured as the discretionary allowances for loan loss obtained from the residual of a regression model
2	Joint Audit	Joint Audit	Independent	Dichotomous: '1' if company is involved in Joint audit, "0" if otherwise.
3	TENURE	Audit Tenure	Independent	Number of consecutive years an auditor retains a client
4	SPEC	Auditor Industry Specialization	Independent	Proportion of banking incomes audited in a given year
5	AudiND	A measure of Auditor Independence	Independent	Natural Log of audit fees and non-audit fees paid by the company
